Data to Support Community Development Block Grant

The U.S. Department of Housing and **Urban Development (HUD's) Community Development Block Grant program for long-term disaster recovery (CDBG-DR)**, are congressional appropriations made following a disaster. These CDBG-DR funds are used by states and local communities to address their unmet recovery needs stemming from Presidential disaster declaration. These funds are usually used for infrastructure, housing recovery, and economic development and revitalization. Recently a congressional appropriation was made to address hazard mitigation to enhance resilience and reduce the threat posed by future hazards.

The funds are administered by the Texas General Land Office (GLO) and an Action Plan (see link below) provides details on the proposed use of all funds, including eligibility criteria, eligible applicants, and maximum award amounts. The total allocation for the Coastal Bend is \$179,547,000.

Figure 3-16: The Aspects of Mitigation

Community Development Block Grant – Mitigation (CDBG-MIT)

Regional Mitigation Program (COG MOD):

- Each Council of Governments (COG) impacted by Hurricane Harvey will be allocated funds.
- Each COG will develop a method of distribution (MOD) to allocate funds to local units of governments.
- Each project must mitigate against one of the top two severe risks Texas experiences:
 - hurricanes/tropical storms/tropical depressions
 - severe coastal/riverine flooding
- At least 50% of funds must address mitigation needs in HUD Most Impacted and Distressed (MID) areas.
- 50% of all CDBG-MIT funds must benefit low-to-moderate income (LMI) persons.

Purpose of this Document:

This report presents data used for developing a Method of Distribution for the Coastal Bend Council of Governments, as part of a [Regional Resilience Partnership](#) (RRP) collaboration. The data is a combination of information that the GLO suggested COGs use, as well as other information developed by the RRP team and approved by GLO. This report provides a visualization and description of the data and their sources.

Please email RRP@tamucc.edu with any questions or suggested edits.

Data Description and Source

Geographic Area in Flood Hazard Zone: Percent of the land area in a flood prone area. This was calculated by comparing the extent of the Texas Floodplain Quilt within Census places and counties.

<https://twddb-flood-planning-resources-twddb.hub.arcgis.com/pages/flood-hazard-quilt>

Population: Population data used in this document are from the 2019 and 2020 American Community Survey 5-Year Estimates. Using these data a change in Population (%) was calculated as is represented as percent-change from 2019 to 2020.

<https://www.census.gov/programs-surveys/acs/data.html>

Low and Moderate Income (LMI): The percentage of Low- and Moderate-income persons within a geography.

<https://hudgis-hud.opendata.arcgis.com/datasets/HUD::low-to-moderate-income-population-by-tract/about>

Social Vulnerability Index (SoVI): SoVI is an index that provides a measure of social vulnerability. The index uses a ranking system ranging from 1-5 representing Low to High vulnerability. This dataset, published in 2016, was compiled from both the 2010 U.S. Decennial Census and 5-year estimates from the American Community Survey (ACS) using detailed county boundaries.

https://sc.edu/study/colleges_schools/artsandsciences/centers_and_institutes/hvri/documents/sovi/sovi_recipe_2016.pdf

Declared Disasters- The number of declared disasters summarized by Census Place was obtained from the FEMA's Individuals and Households Program and include the Count of declared disasters (2002-2019) per geography. Other measures included in this document are the Count of FEMA Individual Assistant Applicants (summarized by geography) and the number of Properties Destroyed.

<https://www.fema.gov/disaster/declarations>

Floodplain and Flood Hazard Areas

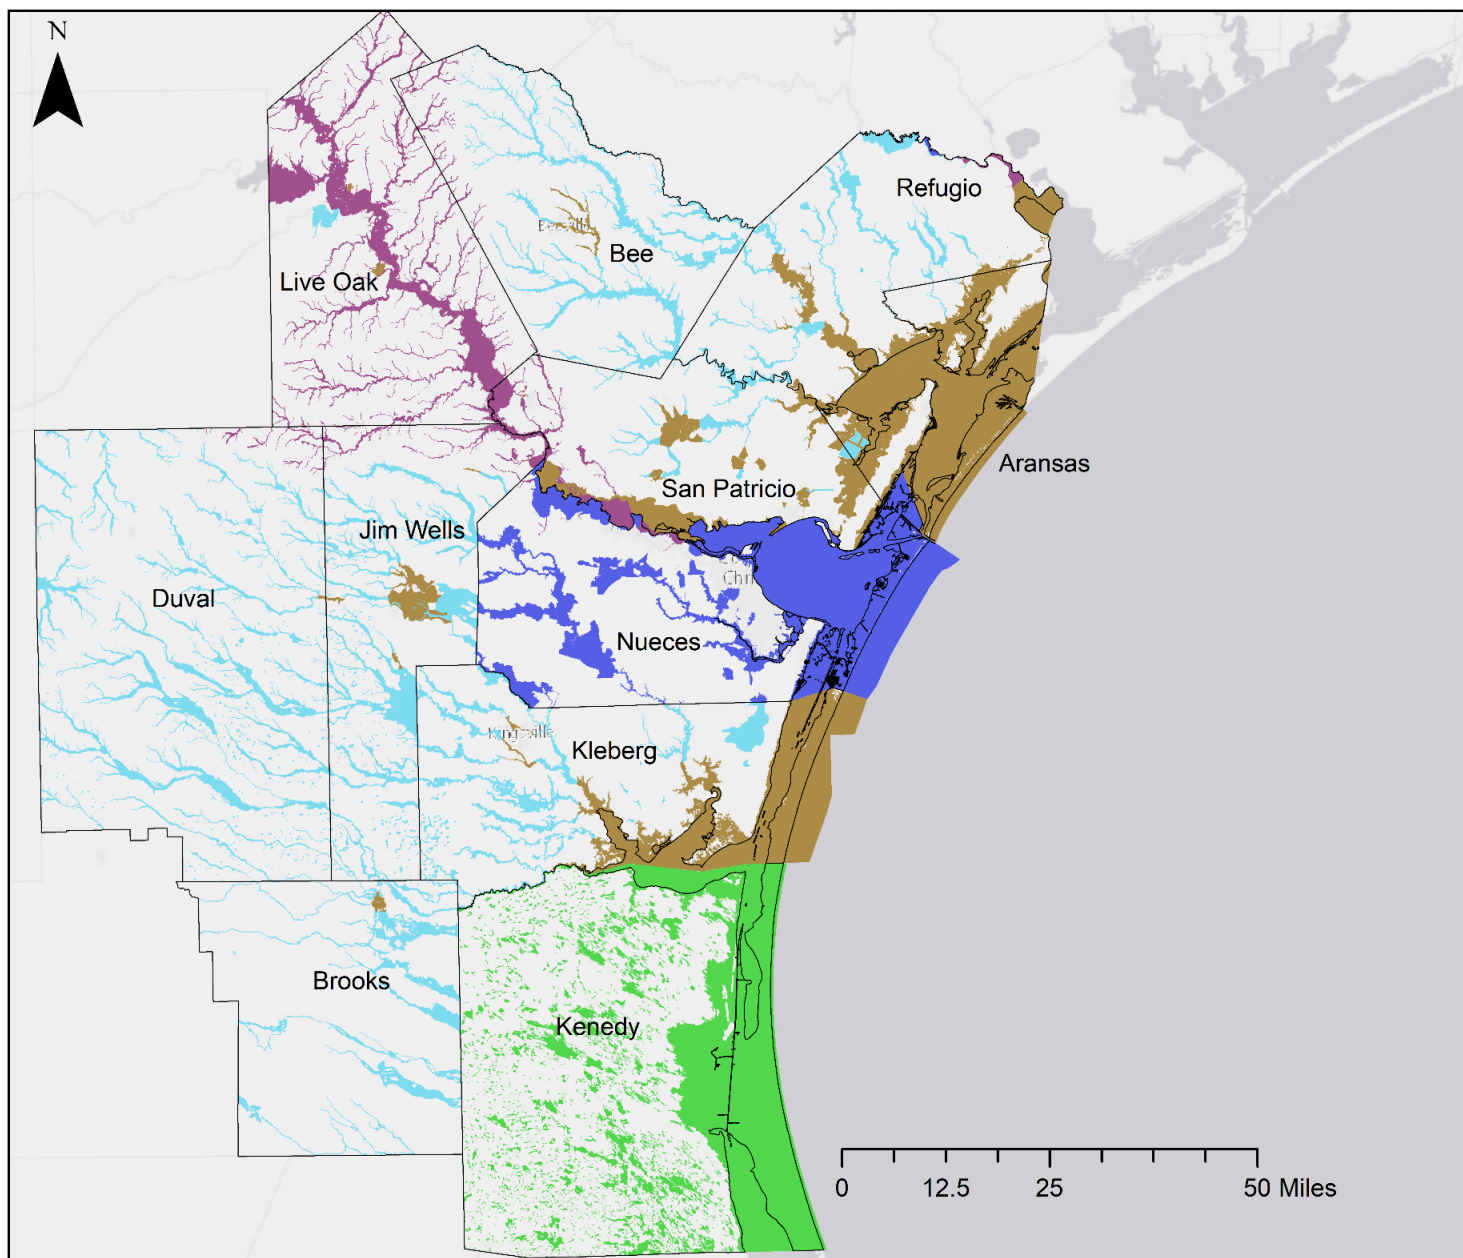

- A **floodplain** is any area susceptible to flooding from any source. Potential sources include coastal storms like hurricanes with storm surge, rainfall, downstream runoff, and elevated high tides.
- Flood hazard areas are typically determined by FEMA for the development of Flood Insurance Rate Maps. These flood zones represent a flood's statistical return period or how likely it is to occur in a given period of time. The two most highly used flood return period are the 1% annual chance flood and the 0.2% annual chance flood.
- **The 1% annual chance flood**
 - Also known as the base flood or 100-year flood, it is a type of flood that has a one-in-100 or 1% chance of occurring in any given year. This means that over 30 years there is a 26% chance a 1% annual chance flood will occur.
 - These zones may appear labeled as : Zone A, Zone AO, Zone AH, Zones A1-A30, Zone AE, Zone A99, Zone AR, Zone AR/AE, Zone AR/AO, Zone AR/A1-A30, Zone AR/A, Zone V, Zone VE, and Zones V1-V30.
 - V-zones are coastal areas with a 1% or greater chance of flooding and an additional hazard associated with storm waves
- **The 0.2% annual-chance flood**
 - Also known as a one-in-500 or 0.2% chance of occurring in any given year. This means that over 30 years there is a 5.8% chance a 0.2% annual chance flood will occur. A 0.2% annual chance flood is also known as a 500-year flood. These type of floods are considered a moderate flood hazard.
 - These zones may appear labeled as: Zone B or Zone X

Texas Flood Quilt (2021): Map Source

Legend

 County Boundary

Texas 2021 FloodQuilt Source Data

SOURCE

-  BLE
-  FAFDS
-  NFHL EffectiveApproximate
-  NFHL EffectiveDetailed
-  NFHL PRELIMINARY

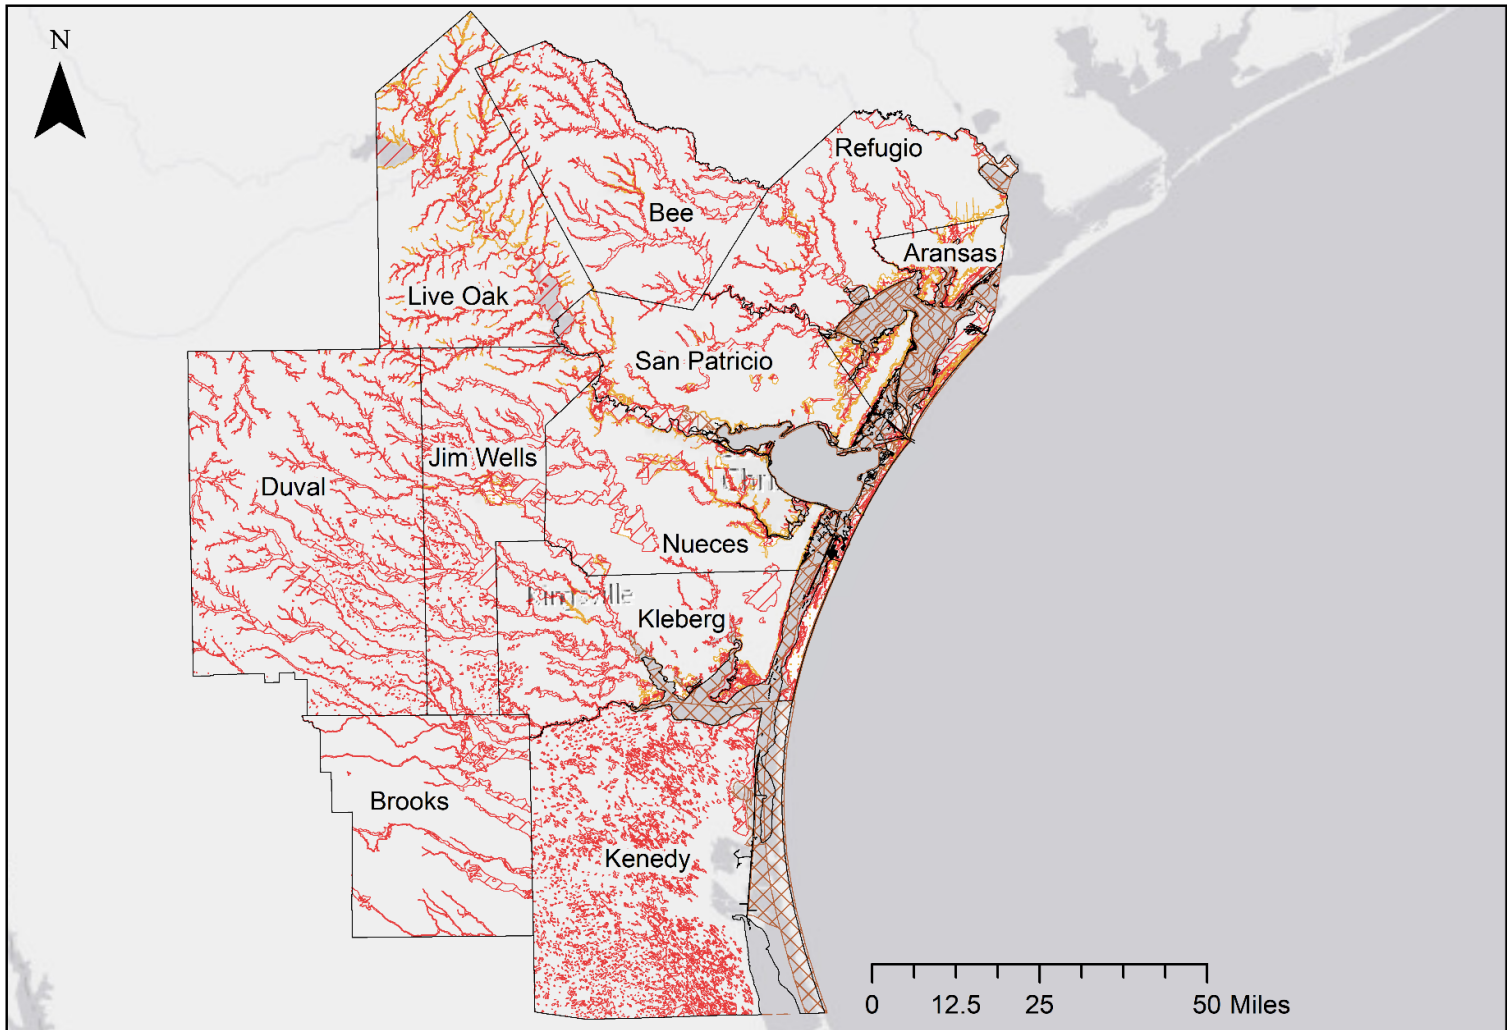

The floodplain quilt was developed by the Texas water Development Board and consists of multiple layers from various sources. These layers are 'quilt' together to a single flood hazard dataset. Input data for the quilt uses a ranking/prioritization method to provide the best available data at large scale. The ranking order is as follows:

1. National Flood Hazard Layer (NFHL) Pending Data*
2. National Flood Hazard Layer (NFHL) Preliminary Data*
3. NFHL Effective Data (Detailed Study Areas only) *
4. Estimated Base Flood Elevation Viewer (BLE)*
5. NFHL Effective Data (Approximate Study Areas only) *
6. First American Flood Data Services (FAFDS)*

* See appendix for a detailed description of flood map sources (page 66)

The Social Vulnerability Index is a measure of a community's ability to prepare for, respond to, and recover from environmental hazards. The index considers several variables related to housing, employment structure, population structure, socio-economic status, race/ethnicity and special needs.

Appendices

Floodplain Quilt Prioritization

1. **National Flood Hazard Layer (NFHL) Pending Data:** This data will have flood hazard information comprised of the most recent detailed and approximate studies (compared to the other datasets) and are pending release as a FEMA Effective Flood Insurance Rate Map (FIRM). This data is (in a very broad sense) considered the best available data of the compiled data sets.
2. **National Flood Hazard Layer (NFHL) Preliminary Data:** Map of flood risk during the 1% annual chance and 0.2% annual storm events. These FEMA issued maps are for public review and awareness of proposed change. This data includes both detailed and approximate study data.
3. **National Flood Hazard Layer Effective Data (Detailed Study Areas only):** This data has flood hazard information that includes detailed studies (Flood Zones AE, AO, AH, and VE) and is the current Effective FEMA FIRM. This layer includes any FEMA's if modification to an effective Flood Insurance Rate Map that was effective when TWDB downloaded the data. Up to date effective FEMA floodplain and any other Letter of Map Revision (LOMR) information can be viewed through FEMA's NFHL Viewer separately.
4. **Estimated Base Flood Elevation Viewer:** This data contains flood hazard information created by approximate base level engineering (BLE) data that can be used as best available information where approximate Zone A's on the effective FIRM exist, but they do not replace flood hazard data found in a detailed study area. Hence this data is ranked 3rd, in between detailed (rank 2) and approximate (rank 4) effective data.
 1. In general, only the highest rank data was included in a given study area whether that data had wider or skinnier floodplains. However, BLE and detailed studied effective data is represented slightly differently. In study areas with both detailed NFHL and BLE data, areas that were designated in 1% or 0.2% annual storm events in the BLE data, but not designated as such in detailed studied area are designated as 1% or 0.2% annual storm events in the floodplain quilt. This incorporates streams that were captured in the BLE modeling, but not in the detailed study, and also incorporates wider BLE floodplains with skinnier detailed study floodplains, resulting in a more comprehensive and conservative floodplain.
5. **National Flood Hazard Layer Effective Data (Approximate Study Areas only):** This data has flood hazard information that includes approximate studies (Flood Zone A) on the effective FIRM map. Where approximate Zone A's exist on the effective FIRM there is no effective detailed study information.
6. **First American Flood Data Services (FAFDS):** This data contains digitized flood hazard information from previously published FIRMs and FISs and is not available on the NFHL. Even if certain areas in this data set include detailed study (such as AE zones), it is likely very old and thus it is anticipated that BLE data will be more accurate. This is one example where a conflict may occur between best available 'planning' data and best available 'regulatory' data.
7. **Other Sources:** Other sources are not yet available, so they are not yet ranked. Conceptually, how they could be ranked are described below.
 1. Cursory Floodplain (Fathom)
 2. USACE or other federal data
 3. Regional or Local flood risk data
